

# Applied Drug Therapy

## Homework #11

L.S. is a 26 y/o sexually active male who presents to the clinic with complaints of mild dysuria and a mucoid urethral discharge of recent onset (last 3 days). The patient was otherwise well and without complaint of fever, lymphadenopathy, hematuria, or any lesions on the genitals. Gram stain of the discharge showed no microorganisms and 20 PMNs per oil immersion field. The patient is currently taking no maintenance medications and is allergic to sulfa drugs and codeine.

1. What is the most likely diagnosis in this patient? (5 points) \_\_\_\_\_

2. L.S. has an excellent prescription drug benefit with his health insurance program and has to pay only \$10.00 per prescription (no matter the cost of the drug). Because of his hectic work schedule and social calendar, please write a prescription for L.S. that is appropriate given these considerations (10 points).

<b>Primary Care Associates, Inc.</b> <b>1020 Wellness Road</b> <b>Resume Speed, KS</b> <b>(913) 123-4567</b>
